

Velocity-Temperature Non-Correspondence: Same Velocity, Different "Temperature Meaning"

A. Overlapping Distributions

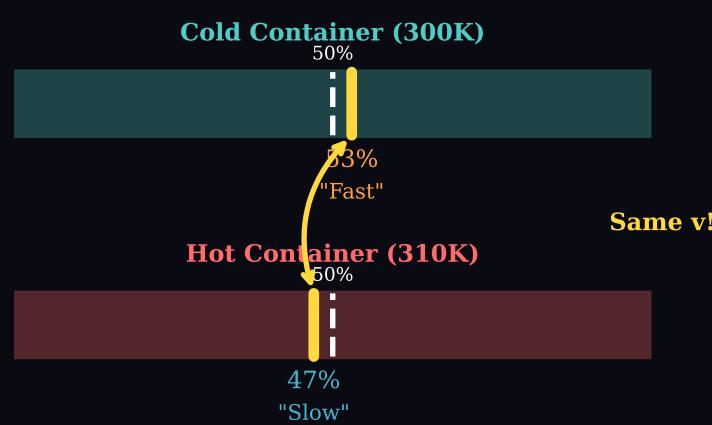

B. Same Velocity, Different Meaning

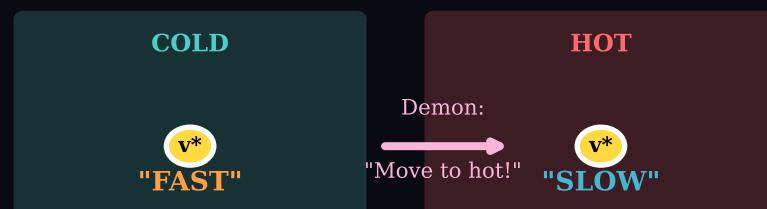

Same velocity, opposite categorical meaning!

C. Velocity Percentile by Context

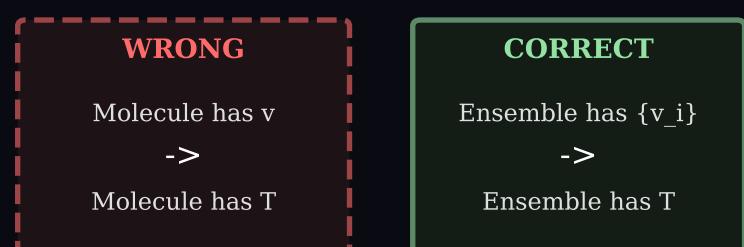

D. Sorting Paradox

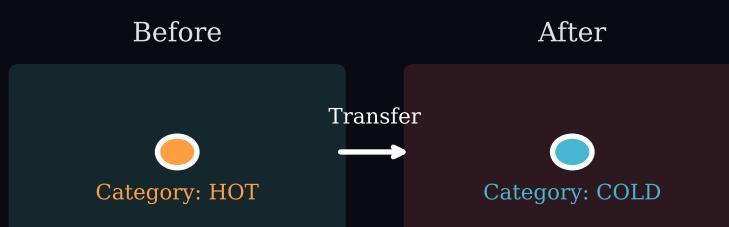

PARADOX:
Intended: Add "fast" to make hotter
Result: Added "slow" - makes COLDER!
Demon achieved the OPPOSITE

E. No Molecular Temperature

$T = T[\{v_1, v_2, \dots, v_N\}]$
Temperature is a FUNCTIONAL of distribution
NOT a function of individual velocity
Only ENSEMBLES have temperature

F. Category Changes on Transfer

Velocity: UNCHANGED
Category: INVERTED

Context determines meaning

G. Why Demon Cannot Sort by T

1. Temperature is not a molecular property
2. Velocity does not determine T contribution
3. T contribution is ensemble-relative
4. Transfer changes categorical meaning

Sorting by velocity \neq sorting by temperature

H. Overlap Region Problem

Every velocity exists in both distributions

The overlap is COMPLETE

I. The Insight

Velocity \neq Temperature

Same velocity v:
In cold: "FAST" (contributes to hotness)
In hot: "SLOW" (contributes to coldness)

The demon sorts by velocity
but CANNOT sort by temperature

Temperature is contextual, not intrinsic
