

Parallel Operation: Zero Chronological Time Simultaneity

A. Sequential vs Parallel Operation

Parallel Operation Principle

Test Configuration:

- BMD Depth: 10
- Channels: 59,049
- Simultaneous: True
- Chronological Time: 0.0

Key Insight:

All 59,049 channels operate in CATEGORICAL SPACE, not physical time.

Categorical completion occurs instantaneously across all channels.

$$\therefore \text{Chronological time} = 0$$

This is NOT parallelization in the conventional sense (multi-threading).

It's CATEGORICAL SIMULTANEITY:
All states accessed at once through equivalence class selection.
